                                                                                                                                                                No.
         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                             Score

                                                                                    non-activated adult donors. Library is oligo-dr primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.7 kb, insert size range full-1-as, kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics trackers and constructed by C. Gruber (Invitrogen). PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The CDNA was directionally cloned into lambda and the color of the col
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ZAP clones by superinfection with Exassist (Stratageme) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  chauser@duke.edu
/note="Vector: pBluescript II SK-; Site_1: EcoRI; Site_2: XhOI; This library, constructed by John Davies and Jeffrey McDermott, combines cDNAs from CC-1590 cells grown to mid-log phase in TAP (acetate-containing) medium in the light, TAP medium in the dark, HS (minimal) medium in ambient levels of CO2 and HS medium bubbled with 5% CO2. POLYA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda 2AP II (Stratagene) in the EcoRI (5') and XhOI (3') sites. pBluescript II SK- plasmids were excised from the lambda

                                /note="wector: pBluescript II SK-; Site_1: EcoRI; Site 2: XhoI; Stress condition II library, constructed by John Davies and Jeffrey WcDermott. combines cDNAs from CC-1690 cells grown to mid-log phase in TAP (NH4+ - containing) and shifted to TAP - NO3- (24hrs); H2 production conditions (0, 12hr, 24hr) see Melis et al., (2000) plant Phys. 122: 127-135; TAP + H202 (1, 12, 24 hr); TAP + Sorbitol (1, 2, 6, 24 hr); TAP + Cd (1, 2, 6, 24 hr). PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda ZAP II (Stratagene) in the EcoRI (5) and XhoRI (3') sites. pBluescript II SK- plasmids were excised from the (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al., (1996) Genome AS a 2006 G: 128.65."

PolyA mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned into lambda AP II (Stratagene) in the ECORI (5') and XhoI (3') sites. pBluescript II SK- plasmids were excised from the lambda and contained the contained that the lambda and contained the contained that the contained that the lambda and contained the contained that the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ZAP clones by superinfection with EXASSISt (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is an allele-specific oligonucleotide primer for the T allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome 5g31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T copies to higher expression of the gene. This is because the C polymorphism is found in the 5 leader sequence, which encodes a peptide c which regulates expression of the beta2AR gene. The polymorphism is c thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, migraine, anaphylaxis and chronic obstructive pulmonary disease (CODD). The gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can, therefore, be used to predict the susceptibility of an average of the gene can.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    non-responsive, or at a risk for an adverse response, to a particular treatment regimen. Adverse results in an early trial can be evaluated to identify polymorphic patterns so that the adverse results can be correlated with a sub-population of the test population, permitting exclusion of such sub-populations from the treatment group. Beneficial drugs can be approved for use in the appropriate population, thereby turn decreases the duration and cost of such trials. The present sequence represents the human beta-adrenergic receptor 2 gene sequence represents the human beta-adrenergic receptor 2 gene

The polymorphic sites identified are 839A/G, 872C/G, 1045A/G, 1284C/T, 1316A/C, 1846C/G, 2032A/G,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  they encode are useful in the screening of potential cardiovascular drugs. Determination of an individual's polymorphic pattern reduces or eliminates trial and error in selecting a treatment for a particular individual cardiovascular patient. It also provides the ability to eliminate patients from clinical trials who are predicted to be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               or more polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic pattern obtained from a population of individuals exhibiting a predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to

This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   myocardial infarction and stroke. Other conditions that can be determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia nervosa and bulimia, or post-traumatic stress disorder. Diseases of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager and Riley-Day syndromes having colorium control of the system.

                                                                                                                                                                                                                                                                 determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia nervosa and bulimia, or post-traumatic stress disorder. Diseases of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager and Riley-Day syndromes having selective noradrenergic-receptor disposition, or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including redicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used to develom thereasentice and/or lifectule drage.
                                                                                                                                                                             to develop therapeutics and/or lifestyle drugs. Individual specific beta 2-receptor agonists can be developed. Treatments can be optimized for individuals, including gene therapy and pharmaceutical intervention therapy. This sequence represents a variant of the wild type human beta 2-adrenergic receptor gene which is represented in AAZ00773.
                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including myocardial infarction and stroke. Other conditions that can be

determined include neuropsychiatric disease, such as depression, anxiety, CC attention deficit disorder with hyperactivity, eating disorders, e.g. CC anorexia nervosa and bulimia, or post-traumatic stress disorder. Diseases CC of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-brager CC disposition, or migraine, allergic conditions, e.g. asthma and atopic CC disorders, and metabolic illnesses, e.g. morbid obesity including CC predicting a change in weight, using body mass index, can also be CC determined. The beta 2-adrenergic receptor sequence variants can be used CC receptor agonists can be developed. Treatments can be optimized for CC individuals, including gene therapy and pharmaceutical intervention CC individuals, including gene therapy and pharmaceutical intervention CC can developed. This sequence represents a variant of the wild type human beta varianteric receptor gene which is represented in AAZ00773.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including
                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 6; Fig 2a; 27pp; German.

                                                                                                                                                                  This invention describes novel variant human beta 2-adrenergic receptor gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including
                                determined include neuropsychiatric disease, such as depression, anxiety, attention deficit disorder with hyperactivity, eating disorders, e.g. anorexia nervosa and bulimia, or post-traumatic stress disorder, Diseases
                                                                                                                                                                                                                                                                                                                                                                                           Claim 8; Fig 2a; 27pp; German.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human beta2-adrenergic receptor gene variants, useful for determining an individuals haplotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 1999-479048/40.

The present sequence is an allele-specific oligonucleotide primer for the C allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5' leader sequence, which encodes a peptide

arrhythmia, obesity, diabetes, vascular disease,

thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to be the polymorphism is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
proteins have potential immunosuppressive, immunostimulatory, antirheumatic, antisclerotic, antidiabetic, antiinflammatory, cytostatic, antileukemic, neuroprotective and antimicrobial activity and may be useful in gene/protein therapy, vaccines, modulation of the expression and activity of proteins related to angiopoietin, 4-hydroxybutyrate, dehydrogenase, adenosine triphosphate (ATP)-dependent RNA helicase, major histocompatibility complex (MHC) class I histocompatibility antigen and/or phosphoglycerate kinase. Disorders that may be prevented, diagnosed and/or treated by the above methods include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus
                                                                                                                                                                                                                              The invention relates to nucleic acids (AAH79386-AAH80036) encoding polymorphic variants of proteins (AAG98010-AAG98238) related to angiopoietin, 4-hydroxybutyrate, dehydrogenese, adenosine trip osphate (ATP) dependent RNA helicase, major histocompatibility complex (MHC) class I histocompatibility antigen and/or phosphoglycerate kinase. These nucleic acid single nucleotide polymorphisms (SNPs) and the encoded

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  migraine, anaphylaxis and chronic obstructive pulmonary disease (COPD). The gene can, therefore, be used to predict the susceptibility of an individual to these diseases and determine the best treatment.

                                        modification of post-transcriptional protein expression in eukaryotic cells may be carried out through the targeting specific interactions of proteins that bind to RBPs. The gene fragments of the invention are used to identify their optimized sub-fragments, compounds that affect RNA/RBP interaction or mRNA functionality; or RBPs that interact with the compounds. Compounds identified using the gene fragments are potentially useful for therapeutic regulation of gene expression, such as in cases of neurodegeneration, stroke; cardiovascular disease; hypertension; cancer; inflammation; metabolic disorders (obesity and diabetes) and bacterial or viral infection. The present sequence is one of gene fragments of the
                                                                                                                                                                                                                                  Sequences AAH27132 - AAH27151 represent human gene untranslated regions where the corresponding mRNA fragment has RNA binding protein (RBP) binding activity. RBPs mediate the processing of pre-mRNA, the transport of mRNA from the nucleus to the cytoplasm, mRNA stabilisation, translational efficiency, and the sequestration of some mRNAs. Therefore
                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 28; 33pp; English.
                            invention, isolated from the human beta-2 adrenergic receptor gene
                                                                                                                                                                                                                                                                                                                                                                                                        neurodegeneration

                                                                                                                                                                                   This sequence encodes the protein of the invention. The protein of the invention is a beta-2 adrenalin receptor subtype with Kd value of approximately 75 pM against 1251 cyanopindrol. The protein can be used in screening for agonists and antagonists, which are useful in researching asthmatic diseases.

The present sequence is a fragment of the C allele of the human beta2 adrenergic receptor (beta2AR) gene, which is located on chromosome 5q31 (12). The gene has two different alleles, and it has been shown that the presence of two copies of the T allele leads to higher expression of the gene. This is because the polymorphism is found in the 5 leader sequence, which encodes a peptide which regulates expression of the beta2AR gene. The polymorphism is thought to affect individuals' responses to beta-agonists and beta-antagonists, and is likely to influence their predisposition to asthma, hypertension, congestive heart failure, ischemic heart disease, arrhythmia, obesity, diabetes, vascular disease, premature labour, migraine, anaphylaxis and chronic obstructive pulmonary disease (COPD). The gene can, therefore, be used to predict the susceptibility of an individual to these diseases and determine the beat treatment.

                                                                                        Query Match
                                                                                                                                                                                   receptor protein. Beta 2-adrenergic receptor gene alleles may be identified by any known method e.g. denaturing gel electrophoresis or PCR amplification (see also AAV52615-17). Identification preferably comprises amplifying a portion of each allele which includes the sequence encoding residue 16, and optionally also comprises determining nucleotide sequences of these portions (e.g. by automated sequence analysis). The invention identifies a known polymorphism in the beta 2-adrenergic receptor gene as being linked

RESULT 15
                                  attention deficit disorder with hyperactivity, eating disorders, e.g. ancrexia nervosa and bulimia, or post-traumatic stress disorder. Diseases of the autonomous nervous system, e.g. Bradbury-Eggleston, Sky-Drager and Riley-Day syndromes having selective noradrenergic-receptor disposition, or migraine, allergic conditions, e.g. asthma and atopic disorders, and metabolic illnesses, e.g. morbid obesity including
predicting a change in weight, using body mass index, can also be determined. The beta 2-adrenergic receptor sequence variants can be used
                                                                                                                                                                                   gene sequences which have hypotensive, cardiant, neuroprotective and immunosuppressive activity. The products of the invention are used in a method to determine a predisposition for high blood pressure as well as for abnormal blood pressure and other cardiovascular diseases, including
                                                                                                                                                                          myocardial
                                                                                                                                                                                                                                                          This invention describes novel variant human beta 2-adrenergic receptor
                                                                                                                                             determined include neuropsychiatric disease, such as depression, anxiety,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
